

## VZ-HDARM-K – HD Arm Master Kit

The HD Arm and its kit accessories are extremely simple to operate. The clamp attaches to tubes as shipped, or you can insert the wedge-shaped “saddle” to clamp to flat surfaces.

With the master kit, you have several options for mounting the arm: 1) to the clamp 2) to the tripod base 3) directly to a drilled surface. Attaching to the tripod base is fairly self-explanatory. The arm attaches to the clamp at the hex socket. You’ll have to loosen the locking screw and depress the safety catch pin to insert the arm joint into the hex socket, then tighten the locking screw.

Adjusting the arm is very intuitive. Simply loosen the large handle in the center and you’ll see the end joints can rotate. Loosen the large handle enough and you can disengage the serrated clutch in the middle and change the angle of the two main arm sections. The position of the large handle can also be rotated without loosening the joint by lifting the handle up and turning it (lifting disengages the screw mechanism).

The included brass stud is threaded ¼”-20 one end and 3/8”-16 on the other end – likewise with the arm end joints. Also included are ¼”-20 and 3/8”-16 studs w/ washers for increased mounting flexibility and for mounting to the VariZoom QuickJib or SnapCrane (late models only).

When using the arm in any mode, please make sure all joints are secure and the system will not collide or interfere with any moving parts. With the tripod mode in particular, use caution and don’t leave the system unattended. The maximum recommended load is 5 pounds, but if you’re not careful with the setup, the system could tip over.

The HD Arm is very intuitive and robust, so we encourage you to play around with it to get the best idea of how to use it for your needs. It’s hard to use it wrong – *just don’t try to take it apart, because that’s one thing we don’t cover under warranty! Thanks for your purchase!*
